To optimize the transition to virtual and online simulation-based learning, our Doctorate-Level Nursing Subject Matter Experts can rapidly deploy, enhance and ensure compliance for all level programs.

COVID-19 continues to be a disruptive force touching upon most aspects of our lives. In reaction to the outbreak, hospitals are choosing to no longer honor the clinical contracts with nursing schools that enabled access to nursing students for clinical rotations. While the decision was made based on an understandable rationale of limiting the spread of the virus by removing nonessential personnel and conserving limited resources, the action has caused major obstacles for nursing students and faculty. As a result, many schools are trying to abruptly move from in person clinical to virtual reality and online simulation-based learning.

We can address all level programs and will:

- Work with faculty to select appropriate multi-platforms: virtual reality, web, and mobile clinical simulation resources
- Ensure that these technology-based clinical environments meet the regulatory restrictions from appropriate State Boards of Nursing and comply with INACSL Standards of Best Practice
- Provide the integration required to move these resources transparently into the existing curriculum, or assist with more complex curriculum revision
- Develop the process involving pre- and post-conferencing of interactive, experiential learning
- Learn how to utilize this new approach to enhance evidenced-based learning and critical thinking
- Establish appropriate documentation meeting informatics/data to manage and enhance patient outcomes
- Assist with the integration of the institution’s learning management system
